I. EXECUTIVE SUMMARY

This report aims to share the scope, measurement, and calculation details of the energy efficiency of Hydromx® technology in a Chiller system that only cools a room where the electrical panels of the MCC Machinery Park are located at the Hayat Kimya Paper Factory. The study was carried out by the collaboration of Hayat Kimya AS - Global Energy Group, Johnson Control International (JCI) Turkey - After Market Division, and Hydromx Inc Eurasia Office.

In this study, baseline data with Water and post data with Hydromx® – Efficient Heat Transfer Fluid periods were compared according to the International Performance Monitoring and Verification Protocol (IPMVP) by the World Energy Valuation Organization.

The data was recorded for 15 days for the water period and 25 days for the Hydromx® period. All the data was collected by the data analyzers owned by the Hayat Kimya AŞ with minimum human involvement as required by the IPMVP. All the data, together with the approval signatures of all the parties, is shared in the APPX section at the end of the report.

The comparison was made between two periods and the results were adjusted particularly for the weather conditions as required by the IPMVP. It was calculated that an average saving of 19% was achieved in overall "System" Energy consumption and 23% in the "Chiller" consumption.

Hayat Kimya, Hydromx Inc, and Johnson Controls International (JCI) all accepted the methodologies used and the analysis results. Through this performance, a maximum 3-year ROI period was verified over the list price of Hydromx®.

The impact of other external conditions, that could not be quantified, was also emphasized in the calculation and conclusion sections. Based upon the system's energy consumption trends, unquantifiable external conditions, which were examined in detail later in the report, were predicted to have a positive impact of a minimum 5% to 7% addition to the chiller efficiency. However, the conclusion section did not encapsulate the unquantifiable conditions' predicted saving.

In the Hydromx® period, although the outdoor weather conditions were significantly warmer and humid, the room temperature continuously remained lower than the target temperature of 25°C. It can also be observed from the data graphs that the target room temperature had been steadily satisfied during the Hydromx® period versus the Water period. In the Water Period the Room Temperature fluctuated erratically in certain periods.

Considering all the results, the increase in the effectiveness of the overall heat transfer process that Hydromx® technology brings to the system has been shown unmistakably.

II. INTRODUCTION

a. HYDROMX®

"Heat Transfer Nano-Fluid"

Hydromx® is the world's first and currently only "commercial" Nano-Technology heat transfer fluid. It has been proven after many years of studies that Hydromx technology has no

negative toxic effects on the environment and organisms by the most stringent international standards. Hydromx® is the only Nanofluid in the World that has cleared Toxicology through NSF International according to the strict standards recognized and set by the Food and Drug Administration (FDA).

Hydromx® is certified and registered for both:

HT1 – Incidental Food Contact

HT2 – Nonfood Contact Heat Transfer

by NSF International and authorized to bear the NSF Registration Mark. NSF International protects and improves global human health. Manufacturers, regulators, and consumers look to NSF to develop public health standards and certifications that help protect food, water, consumer products, and the environment. NSF International recognized Hydromx Inc. and published Hydromx® name.

A nano-fluid is a liquid containing nanometer-sized particles, called nanoparticles. Such fluids are engineered colloidal suspensions of nanoparticles in a base fluid. Nano-fluids leverage the nanoparticles to increase the speed of the heat transfer process. As a result, the required target temperature is satisfied in a shorter amount of time, thereby requiring significantly less energy versus the conventional heat transfer mediums.

First "Efficient Heat Transfer Fluid"

Hydromx® was recognized as the first "Efficient Heat Transfer Fluid" (EHTF) that fulfills the requirements in the EHTF category by the USGBC and the Environment Product Declaration (EPD) System. Furthermore, Hydromx® is the only nano-fluid that possesses NSF International verified & certified the Comparable LCA and EPD documents. With an official verdict, the USGBC approved ASHRAE 90.1 "the Exceptional Calculation Methodology" in the LEED® Green Building Certification Assessment for the EHTF product category rule.

Hydromx® has been used in different types of closed-circuit heating/cooling applications in various geographies of the world and achieved successful results reported by independent 3rd Parties. Hydromx® has also been recognized in academia and has certificates from internationally accredited institutions such as NSF, ASTM, Build-Cert, NACE. F

For this performance test, Hydromx®-EG product was supplied by the Hydromx Inc Eurasia Office. The product is NSF International HT2 certified. This certificate means that the product will not cause any toxic damage to the environment in case of an accidental spill, contamination, or leakage. For more details, please visit www.hydromx.com

b. HAYAT KİMYA AŞ

Hayat Kimya, as the world's 5th largest branded diaper manufacturer and the largest cleaning paper manufacturer in the Middle East, Eastern Europe, and Africa, is an important global player in the fast-moving consumer industry. It reaches millions of homes in more than 100 countries with 14 strong brands such as Bingo, Test, Has, Molfix, Bebem, Molped, Joly, Evony, Papia, Familia, Teno, and Focus in-home care, hygiene, and cleaning paper categories.

JOHNSON CONTROLS KLİMA VE SOĞUTMA

Tel: +90 216 636 5300 Fax: +90 216 636 5365
Yenikapı Vergi Dairesi : 0216 636 0680

There are 46 different Turkish brands produced with advanced technologies in 36 production facilities under the umbrella of Hayat Holding, which meet millions of consumers in 13 countries.

Hayat Kimya, with its affiliates in 10 countries, 18 production facilities, and close to 8.000 employees, in the fast-moving consumer industry, home care, hygiene and sanitary paper categories, Bingo, Test, Has, Molfix, Bebem, Molped, It offers its brands Joly, Evony, Papia, Familia, Focus and Teno to millions of consumers.

Following the facilities in Turkey, Hayat Kimya established Algeria, Iran, Egypt, Russia, Nigeria, and Pakistan production facilities along with the distribution companies in Morocco, Bulgaria, and Kenya. With the production, sales, and distribution operations globally; Hayat Kimya has proven that it is a fast-growing company and a key player in its sector in the World.

As a global company, Hayat Kimya AŞ is aware of its environmental responsibilities. Therefore, following thorough research, it considered this performance test with Hydromx as an innovative and sustainable opportunity towards leaving a lesser carbon footprint.

This pilot project was applied to the cooling system of the Paper milling machine's electrical board room, at the plant located at Başiskele, Kocaeli, Turkey.

Under the leadership of Mr. Sabri Çakmak (Global Energy Group Manager) and supervision of Safa Kumral (Sen. Elect. Eng.), the field team has played the key role in adopting the Hydromx® for CO2 emission reduction and energy saving.

c. JOHNSON CONTROLS INTERNATIONAL (JCI)

JCI, as the Exclusive Partner of Hydromx® in the Middle East and Africa, had been actively part of the project since the inception. Mr. Mustafa Özçam (Director of After Sales Dept. with JCI) witnessed and verified the performance increase of the system. Furthermore, Mr. Özçam's contribution to the Project regarding the chiller behavior was extremely valuable.

III. PROJECT DEFINITION

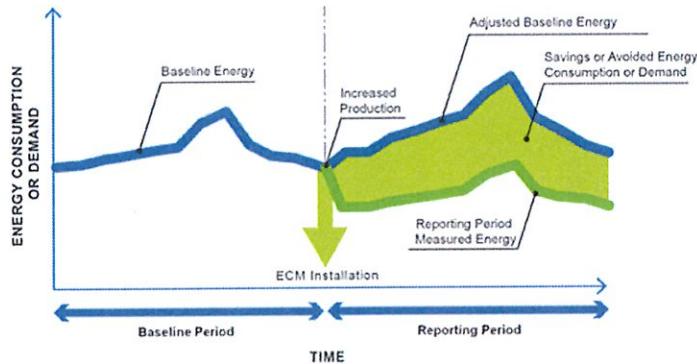

a. SCOPE OF THE PROJECT

More than one type of production activity is carried out under the Hayat Holding at various production facilities. The energy consumption of these facilities is being managed by the Energy Management Unit within the Holding. This particular Unit is responsible for electricity production, heating/cooling (2G, 3G) energies with natural gas conversion plants along with diesel generators, and also manages the efficiency of energy used. It provides uninterrupted service in terms of quality and source reliability as a result of continuous analyses carried out 24x7. Such services include Turkey, Egypt, Bangladesh, and Nigeria.

An improvement in Thermal Energy transfer is definitely among the goals of the Energy Management Unit. A minimum of 20% energy efficiency committed by Hydromx® was taken into consideration by the Unit. With this project, it is aimed to firsthand witness the behavior and observe the capabilities of the Hydromx technology in their facilities, under their complete control.

b. CALCULATION METHODOLOGY

For the energy efficiency calculation, the latest updated protocol (IPMVP) of the “Energy Valuation Organization” (www.evo-world.org), which controls and updates the standards globally, has been applied. The protocol can be briefly expressed by the formula below.

$$\text{Savings} = (\text{Baseline Period Energy} - \text{Reporting Period Energy}) \pm \text{Adjustments}$$

<https://evo-world.org/en/products-services-mainmenu-en/protocols/ipmvp>

The methods of Option-C specified in the last updated IPMVP were used. (APPX C- IPMVP)

The chiller unit that was measured supplies chilled water only to an isolated room and nowhere else. Since the system was controlled 100% by automation and all active parameters were recorded separately, the IPMVP Option C was the most appropriate methodology to apply.

To increase the accuracy of the analysis result, IPMVP Option-C deems it necessary to review the data and make appropriate exclusions. Furthermore, adjustments on time-limited data are crucial especially in this system as the target temperature and average outside temperatures variances have a major impact on the consumption of the chiller.

In this detailed analysis, to accurately show the efficacy of the product, following analytical methodologies had been applied to both dataset:

Simple Comparison: Comparison of active parameters which consists of

- a. Raw Data Analysis
- b. Refined Data Analysis
- c. Adjusted Ambient Temperature Analysis
- d. Same Temperature Comparison Analysis

 JOHNSON CONTROLS KLİMA VE SOĞUTMA

 Yenikapı Vergi Dairesi: 074 001 6130

c. SYSTEM DEFINITION

Hayat Kimya Energy unit wanted to test Hydromx®'s capability primarily in chilled water systems operating at low temperatures as the coolants generally have more stringent conditions to meet than the heating fluids.

The cooling requirement of the electrical panels of the MCC Production Line is sustained by a single chiller unit. The Chiller, with 735KW cooling capacity, consists of 2 compressors with 4 stages. The operational capacity of the compressors is controlled according to the chilled water temperature, which is set to 10°C.

All electrical panels that are associated with the MCC Production line are located in one room and the airflow of the room is air-conditioned by 2 AHUs.

The room is completely isolated from outdoor conditions. It is not exposed to direct sunlight. Seasonal changes affect the overall temperature of the building, and consequently, the temperature of the room is slightly impacted.

The heat generation of the room is due to the electricity drawn by the MCC Machinery's panels. This is the only heat load of the room.

The room is free from personnel and is kept locked throughout the day. Only authorized personnel are allowed if maintenance is required.

All these conditions increase the reliability of the project.

The temperature of the room is targeted to be continuously maintained at 25°C. Chiller and AHU units are managed by the automation system of the factory to maintain this condition. The chiller is designed to supply chilled water of 10°C to AHUs at a constant flow rate.

While one of the AHU units is working continuously, the second is driven by the VFD. The operational capacities of AHUs are completely geared towards to maintain the room temperature. As the temperature of the room rises, the fans speed up and cool down the room to bring the room to setpoint. When the room temperature drops to 25°C and below, the second fan stops completely, while the first fan continues to work.

IV. DATA & ANALYSIS

a. DATA DEFINITION

All of the factors affecting the cooling energy of the system were recorded and downloaded to Hayat Kimya's corporate cloud infrastructure. Below listed factors are logged.

DATA	Unit	Frequency	Logged by
Chiller Electricity Consumption	Watt	10sec	Fluke
AHU Electricity Consumption	Watt	1 min	Fluke
MCC unit (VFD) Electricity Consumption	Kw	1 hr	Fluke
Room Temperature	°C	1 min	SCADA
Ambient Temperature	°C	1 hr	SCADA

Table 1- Logged Factors Table

MCC consumption and outdoor temperature data were recorded hourly, other data was recorded at frequencies of 5 and 10 seconds. All of the data logged and recorded by Hayat Kimya Energy Unit and provided to Hydromx Eurasia Office.

The working principle of the Fluke 430 Series II Three-Phase Power Quality and Energy Analyzers is to take 200,000 records per second and report them at the desired frequencies.

Tables were created by calculating hourly subtotals of energy consumption data and the hourly average of temperature data to fit all parameters at the same timetable. The sample data table is presented in APPX-A.

All the data used in this report was approved and signed by the Hayat Kimya Energy Unit team and presented in APPX-A (data tables).

b. DATA RELIABILITY

According to the IPMV protocol, all data to be calculated should be recorded independently of human intervention. All data recordings were carried out by this rule.

All data was recorded by the automation team in the factory. There are two types of data in total:

JOHNSON CONTROLS KLİMA VE SOĞUTMA
SERVİS SANAYİ VE TİCARET A.Ş.
Saray Mah. Dr. Adnan Büyükdere Bulvarı No:2
Akkom Ofis Park 3. Blok Kat:6/6K 34868 Ümraniye- IST
Tel: +90 216 636 5300 Fax: +90 216 636 2365
Yenikapı Vergi Dairesi 074 011 6130

1. Electricity consumption (kW/hr)

2. Temperature data (°C)

Electricity consumption is logged by the portable Fluke 430 Series II Three-Phase Power Quality and Energy Analyzers. (see APPX E-Analyzer Technical Brochure)

Temperature data are logged by the central automation system of the factory.

All data are shared by the Energy management department in MS Excel format.

c. DATA ANALYSIS

The goal of the entire cooling system is to keep the room temperature constant at 25°C. This condition was not met during certain periods for both before and after data. The IPMVP Option C dictates to have above 0.80 R-squared (R^2) statistical value to obtain reliable results. Therefore, during periods when the system ran extremely contrary to the predetermined working principle were excluded from both data.

As can be seen from the graph below, in the red colored sections.

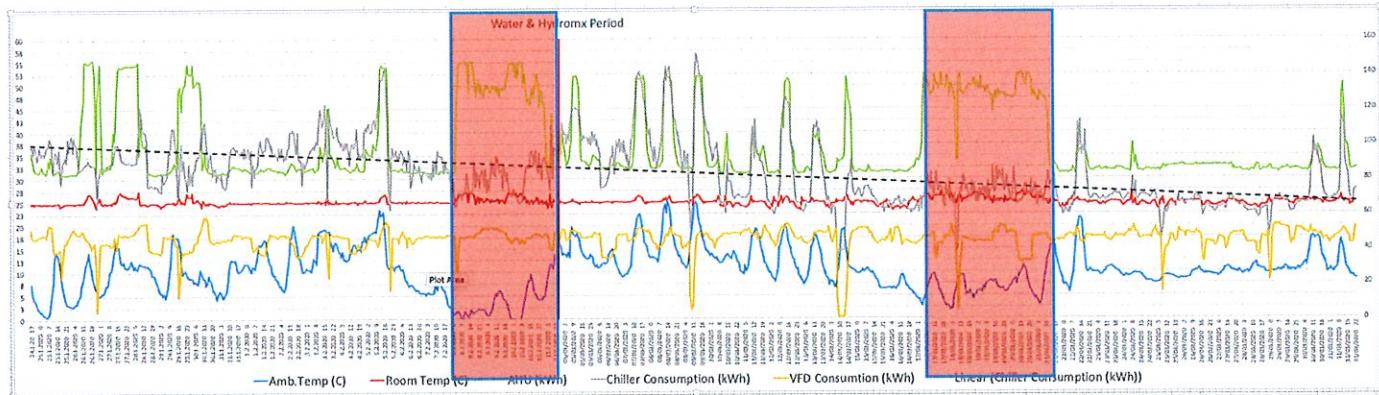

a. Although outside temperatures were lower than the general average,

b. Although the MCC load was stable,

c. AHU and Chiller were running at high performance,

the room temperature could not be maintained at 25°C. Such periods openly violated the predetermined working principle of the system.

After consulting with the Hayat Kimya team regarding the periods in violation, it was mutually agreed upon that such periods were to be removed from both data. Hence, the comparison calculations were made with the "Refined Data". As a result, a significantly more dependable and accurate "apples-to-apples" analysis reporting was achieved.

Chiller and AHU energy consumptions are significantly affected by 2 parameters.

1. Outdoor temperatures (Affects consumption of chiller and room temperature.)
2. MCC consumption (The main factor affecting the room temperature)

As can be verified from the above chart, Chiller and AHU consumptions were extremely affected by Outdoor temps and MCC consumptions. For reliable calculations to be made, such differences ought to be adjusted as defined by the IPMVP. In this analysis, the required adjustments were only made to the Outside Temperatures. Overall averages reflected very closely matched MCC consumptions, therefore had not been adjusted.

V. CALCULATION & RESULTS

Simple Comparison: Comparison of the active parameters.

a. Raw Data Analysis:

The below table represents the simple averages of the dataset enclosed to this report that was provided by Hayat Kimya without any adjustments.

Raw data	Ambient Temp. (°C)	Room Temp. (°C)	Chiller Consumption (kWh)/hr	MCC (kWh)/hr	AHU (kWh)/hr	System Power (kWh)/hr
Water	9,09	25,25	90,31	4.524	38,5	149,8
Hydromx	10,99	24,95	81,96	4.535	37,3	140,2
Difference	+1,9°C (3.5°F)	-0,30°C (0.5°F)	-9,3%	0%	-3%	-6,4%

As it can be clearly observed from the "Difference" row that Hydromx® had significantly improved the overall efficiency of the System whilst operating almost 2 Celsius or 3.5 Fahrenheit degrees higher on average outside temperature conditions. Not only that the chiller consumption had dropped 9,3% but also the target room temperature was steadily kept under 25°C and even maintained 0,3°C or 0.5°F degrees lower temperature than the Water period.

b. Refined Data Analysis:

When the general averages of the recorded parameters were compared with the "Refined Data", as explained in the "Data Analysis" section, the results are as follows:

Refined Data	Ambient Temp. (°C)	Room Temp. (°C)	Chiller Consumption (kWh)/hr	MCC (kWh)/hr	AHU (kWh)/hr	System Power (kWh)/hr
Water	10,09	25,2	92,26	4.474	36,4	149,7
Hydromx	11,70	24,75	81,68	4.555	34,37	137,05
Difference	+1,6°C (2.9°F)	-0,45°C (0.81°F)	-12%	+2%	-5%	-9%

Table 2 Performance Comparison Table with Refined Data

The outdoor temperature and relative humidity were higher by 1,6°C and 15% on average respectively during the Hydromx® period. Despite these disadvantages, a gain of 12% on the chiller consumption and a gain of 6% on the AHU consumption were recorded, and more importantly, the room temperature was 0,45°C or 0.81°F cooler on average.

Both Raw and Refined Data are true testaments to the effectiveness of Hydromx®'s technology.

c. Adjusted Data Analysis:

To be able to accurately compare both periods "adjustments" had to be made to data based upon the behavior of the system for such differences.

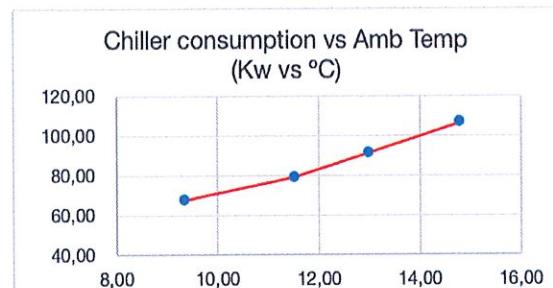

Between the two periods, there was a difference of 1,6°C in "*average outdoor temperatures*". Adjustments on the chiller consumption due to this difference had to be applied according to the IPMVP.

The difference in chiller consumption during the Hydromx® period according to the average outside temperature variance was calculated and summarized in the table below.

1,5°C to 2°C outside temperature change affected chiller and system power consumption by a minimum of 11kW and 13kW respectively.

Amb. Temp (°C)	Amb Temp increment (°C)	Chiller Consumption (kW/hr)	Chiller Power difference (kW)	AHU (kW)/hr	System Power Consumption (kW/hr)	System Power Increment	Room Temp (°C)	MCC Consumption (kWh)
14,81	1,81	106,36	15,09	37,11	165,02	16,60	25,10	4.437,69
13,00	1,50	91,27	11,92	36,10	148,28	13,71	24,86	4.500,12
11,50	2,13	79,35	11,42	34,22	134,57	13,29	24,67	4.530,18
9,38		67,93		32,35	121,28		24,52	4.544,66

If Hydromx® had been operating at 1,6°C colder average outdoor temperature conditions as it was in the water period, the chiller consumption in the Hydromx® period would have been 11kW less, and the System Energy Consumption would have been lower by 13KW. This adjustment ought to be made for a reliable comparison per the IPMVP.

Hence, the "Adjusted Data Table" would be as below:

Refined Data	Ambient Temp. (°C)	Room Temp (°C)	Chiller Consumption (kWh)/hr	MCC (kWh)/hr	AHU (kWh)/hr	System Power (kWh)/hr
Water	10,09	25,2	92,26	4.474	36,4	149,7
Hydromx	11,59	24,75	70,68	4.555	34,39	124,53
Adjusted Diff.	Adjusted	-0,45 (0.81°F)	-23%	+2%	-5%	-17%

Considering the extra energy spent to reduce the room temperature by 0,45°C or 0.81°F and the extra loads caused by the differences in relative humidity & the MCC increase, it would be very accurate to assume that the rate of savings improvement of Hydromx® would have been over 20% with ease.

Objectively, Hydromx® achieved better quality room comfort under more difficult conditions by providing significant energy efficiency.

d. Same Ambient Temperature Analysis:

To check the accuracy of the adjustments applied above; the periods when the room target temperature (25°C) were steadily achieved and the periods with equal outdoor temperatures & equal MCC loads were compared in the tables below.

The results confirmed the validity of “adjustments” applied according to the IPMVP. The chiller efficiency increased by 23,55% and 27,49% along with the System performance increase of 17,56% and 21,61% respectively.

When outside temperatures were at 10°C on average:

Comparison at 10°C	Amb. Temp (°C)	Room Temp (°C)	Chiller Consumption (kWh)	MCC Consumption (kWh)	AHU kW/hr	System Power (kW/hr)
HX 27Mar- 29Mar -- 10:00 - 04:00	10,2	24,4	65,4	4.410,9	32,0	118,3
Water 31Jan – 01Feb -- 17:00 - 08:00	10,6	25,0	90,2	4.481,9	33,2	144,3
Water 02Feb - 03Feb -- 21:00 - 05:00	10,5	25,0	89,0	4.124,2	32,0	142,0
Water 05Feb - 06Feb -- 19:00 - 08:00	11,0	25,0	91,4	4.577,8	32,0	144,3
Water Average	10,7	25,0	90,2	4.394,66	32,4	143,6
Difference	-0,5	-0,59°C	27,49%	-0,37%	1,27%	17,56%

When outside temperatures were at 9°C on average:

Comparison at 9°C	Amb. Temp (°C)	Room Temp (°C)	Chiller Consumption (kWh)	MCC Consumption (kWh)	AHU kW/hr	System Power
HX 23Mar - 27Mar -- 20:00 - 10:00	8,93	24,57	69,16	4.558,86	32,43	122,59
Water 29Jan - 30Jan-- 19:00 - 19:00	8,93	25,43	90,46	4.533,28	44,91	156,38
Difference	0,00	-0,86°C	23,55%	-0,56%	27,80%	21,61%

 Yenikapı Vergi Dairesi : 074 011 6130

VI. CONCLUSION

The Hydromx® performance test was performed by comparing the total cooling energy consumption of the "Before (Water) and After (Hydromx®)" periods.

According to the automation scenario, the room temperature was set to 25°C. The AHUs & Chiller were configured to keep the temperature steady at 25°C. The periods that significantly violated this rule were excluded from both before and after data by applying the same criterion, as openly indicated in the Data Analysis section and agreed by Hayat Kimya Team.

Hydromx® dropped the target room temperature further down in all conditions versus water. The extra consumption of the chiller due to 0,50°C or 0.90°F excessive cooling would have been recovered via proper optimization made to the automation & control systems. It would be safe to assume that such optimization would have added at least an additional 5%-7% savings on energy consumption. This evaluation was made based on the consumption behavior of the system derived from the data.

The explicit outcome of this study is that Hydromx® had succeeded to maintain the target room temperature, on average, 0,50°C (0.90°F) lower than the water by consuming less energy under worse ambient conditions.

This Chiller is an air-cooled type chiller. Air-cooled chillers are significantly affected by the relative humidity of the outdoor environment. This effect was completely ignored in this analysis. The relative humidity recorded by the weather station was 15% higher during the Hydromx® period. If the chiller manufacturer's technical data sheet was available such an impact on the chiller consumption would have been quantified and included in this analysis accordingly.

Based on the result of "the Simple Comparison Method", an hourly average of 26 kW was saved from the energy consumption of the system. With an average consumption of 300 days x 24 hours, it would mean an energy saving of 187.200,00 kW/year. This would equate to a yearly savings of \$14,976.00 with a unit price of \$ 0.08/kWh. Considering the retail list price of Hydromx®, ROI (Return of Investment) would be a maximum of 3 years.

FLUKE ®

Fluke 430 Series II Three-Phase Power Quality and Energy Analyzers

Technical Data

More detailed power quality analysis capability, and a new Fluke-patented energy monetization function

The new 430 Series II Power Quality and Energy Analyzers offer the best in power quality analysis and introduce, for the first time ever, the ability to monetarily quantify energy losses.

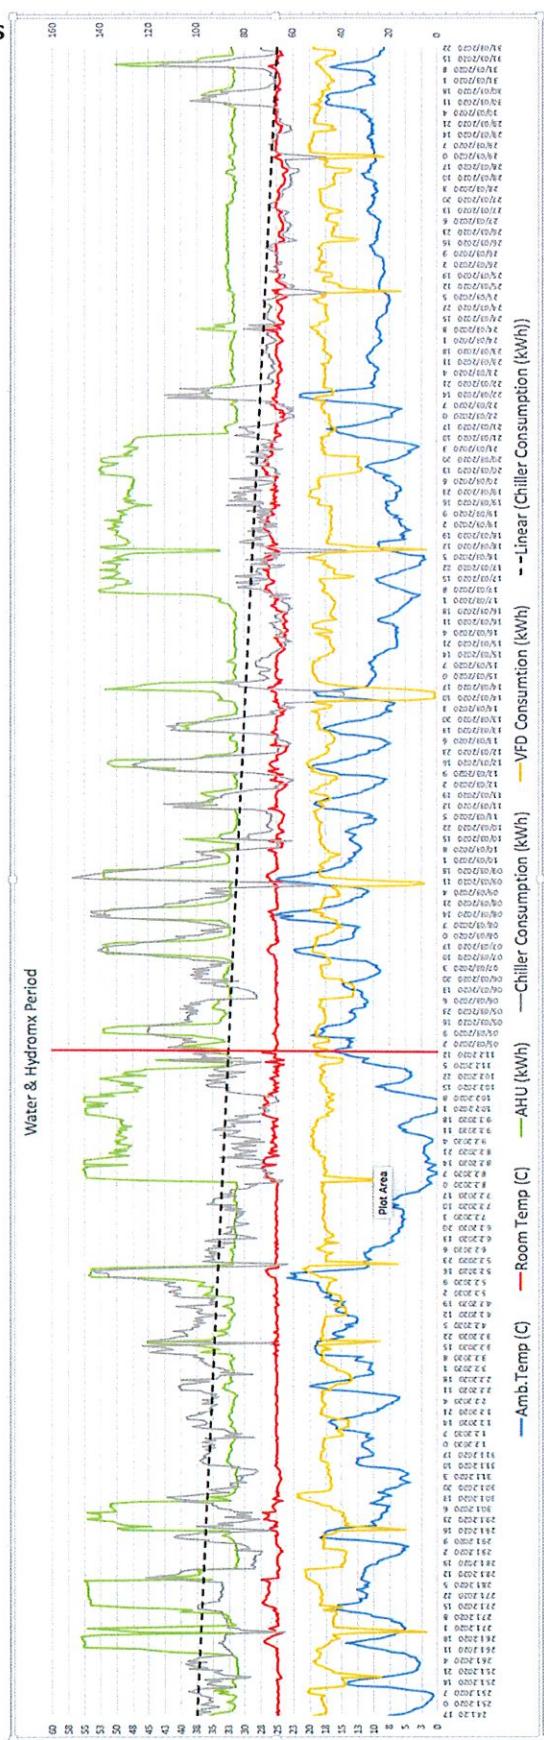

The new Fluke 434, 435 and 437 Series II models help locate, predict, prevent, and troubleshoot power quality problems in three-phase and single-phase power distribution systems. Additionally, the Fluke-patented energy loss algorithm, Unified Power Measurement, measures and quantifies energy losses due to harmonics and unbalance issues, allowing the user to pinpoint the origin of energy waste within a system.

- Energy loss calculator: Classic active and reactive power measurements, unbalance and harmonic power, are quantified to pinpoint true system energy losses in dollars (other local currencies available).
- Power inverter efficiency: Simultaneously measure AC output power and DC input power for power electronics systems using optional DC clamp.
- PowerWave data capture: 435 and 437 Series II analyzers capture fast RMS data, show half-cycle and waveforms to characterize electrical system dynamics (generator start-ups, UPS switching etc.).
- Waveform capture: 435 and 437 Series II models capture 50/60 cycles (50/60Hz) of each event that is detected in all modes, without set-up.
- Automatic Transient Mode: 435 and 437 Series II analyzers capture 200 kHz waveform data on all phases simultaneously up to 6 kV.
- Fully Class-A compliant: 435 and 437 Series II analyzers conduct tests according to the stringent international IEC 61000-4-30 Class-A standard.
- Mains signaling: 435 and 437 Series II analyzers measure interference from ripple control signals at specific frequencies.
- 400 Hz measurement: 437 Series II analyzer captures power quality measurements for avionic and military power systems.
- Troubleshoot: Analyze the trends using the cursors and zoom tools.
- Highest safety rating in the industry: 600 V CAT IV/1000 V CAT III rated for use at the service entrance.
- Measure all three phases and neutral: With included four flexible current probes with enhanced thin flex designed to fit into the tightest places.
- Automatic Trending: Every measurement is always automatically recorded, without any set-up.
- System-Monitor: Ten power quality parameters on one screen according to EN50160 power quality standard.
- Logger function: Configure for any test condition with memory for up to 600 parameters at user defined intervals.
- View graphs and generate reports: With included analysis software.
- Battery life: Up to 8 hours operating time per charge on Li-ion battery pack.
